Population Growth

-  New York City's enumerated population was 8,175,133 persons as of April 1, 2010, the largest enumerated census population in the city's history.
-  The city's population grew by 166,855 persons or 2.1 percent over the 2000 count of 8,008,278.
-  Staten Island grew by 25,002 people, reaching 468,730 in 2010. This represents a growth rate of 5.6 percent, higher than any other borough.
-  The Bronx increased by 3.9 percent over the decade, reaching 1,385,108 in 2010, while Manhattan's population stood at 1,585,873 in 2010, an increase of 3.2 percent.
-  Brooklyn's population reached 2,504,700 in 2010, an increase of 39,374 over 2000, or 1.6 percent. While Brooklyn retained its status as the city's most populous borough, growth in the past decade was below the city average.
-  Queens had the lowest growth in the city. Its enumerated population of 2,230,722 in 2010 was virtually unchanged from 2000.
-  The Department of City Planning believes that the low enumerated growth in Brooklyn and Queens was a result of shortcomings of the census enumeration; it is also inconsistent with administrative data examined by the department.
-  New York State's population reached 19,387,102 in 2010, reflecting growth of 2.1 percent, which was identical to that of New York City. As a result, New York City's share of the State's population was unchanged at 42.2 percent.
-  The nation's enumerated population climbed from 281,421,906 in 2000 to 308,745,538 in 2010, an increase of 9.7 percent.

*Achieved population peak in 2010

† In 2003, Louisville city and Jefferson County combined to form a consolidated government. 2000 population and population change are not available for this geography.

If Staten Island were an independent city, it would be the 35th largest city in the country.

Population Division
New York City Department of City Planning (March 2011)

Population Change in the Nation's Largest Cities

-  New York City, by far, was the largest city in the nation in 2010 with a population of 8,175,133. Los Angeles, the second largest city, had less than half of New York City's population.
-  Cities registering major gains were primarily in the South and West. These included Fort Worth (39 percent growth), Charlotte (35 percent), Austin (20 percent), San Antonio (16 percent), El Paso (15 percent), and Jacksonville (12 percent). These cities, as well as others such as Los Angeles, achieved their population peak in 2010.
-  In contrast, many cities in the Northeast and Midwest lost population over the past decade and were well below their population peaks that were mostly attained in 1950. Detroit's population, for example, peaked in 1950 at 1,849,568; its population in the past decade declined from 951,270 in 2000 to 713,777 in 2010. Similarly, Chicago experienced a decline from 2,896,016 in 2000 to 2,695,598 in 2010, both well below its 1950 peak of 3.6 million.
-  However, some Northeastern and Midwestern cities saw an increase in their populations. Although well below its population peak of 2.1 million in 1950, Philadelphia experienced a modest increase in its population, from 1,517,550 in 2000 to 1,526,006 in 2010. Rivaling many Southern and Western cities with its population gains, Columbus increased its population 11 percent. Likewise, Indianapolis's population increased from 781,870 in 2000 to 820,445 in 2010. Like other cities experiencing considerable growth, Columbus and Indianapolis achieved their population peak in 2010.
-  If the boroughs were considered cities for the purposes of comparison, with the exception of Staten Island, each would rank among the top ten U.S. cities. Brooklyn would be ranked fourth, Queens fifth, Manhattan seventh, and the Bronx tenth.

Population of New York City, 1900 – 2010

Source: US Census Bureau

Population Division
New York City Department of City Planning (March 2011)

Population of New York City, 1900-2010

-  New York's population grew for most of the 20th century. In 1900, two years after the consolidation of the five boroughs of New York, the city's population stood at 3,437,202. Population growth, fueled by immigration, was highest in the very first decade of the 20th century, with the city's population increasing 39 percent, reaching 4,766,883 in 1910. Continued immigration, domestic inflows, and natural increase (births minus deaths) resulted in further increases, with the city's population reaching 6,930,446 in 1930.
-  While immigration tapered off in the 1930s and 1940s, the city continued to grow due to migration from the South and from Puerto Rico. By 1950, the city's population had reached 7,891,957. High baby boom fertility and domestic inflows in the 1950s did not fully counter the large out-migration to the suburbs, and growth dipped during this period. With the enactment of the 1965 Immigration Amendments, immigration to the city increased and the population rebounded by 1970, reaching 7,894,862, the second-largest enumeration ever.
-  The increase in immigration in the 1970s, while substantial, was insufficient to counter the very large domestic outflow. As a result, the city's population declined in the 1970s by more than 10 percent, dropping to 7.1 million in 1980. Lower domestic out-migration in the 1980s, a higher level of immigration, and greater natural increase all resulted in a return to growth, with the city's population enumerated at 7.3 million in 1990. With continued growth in the 1990s, for the first time the city's population crossed the 8 million mark in 2000 and reached nearly 8.2 million in 2010.

Population of New York City Boroughs, 1900 – 2010

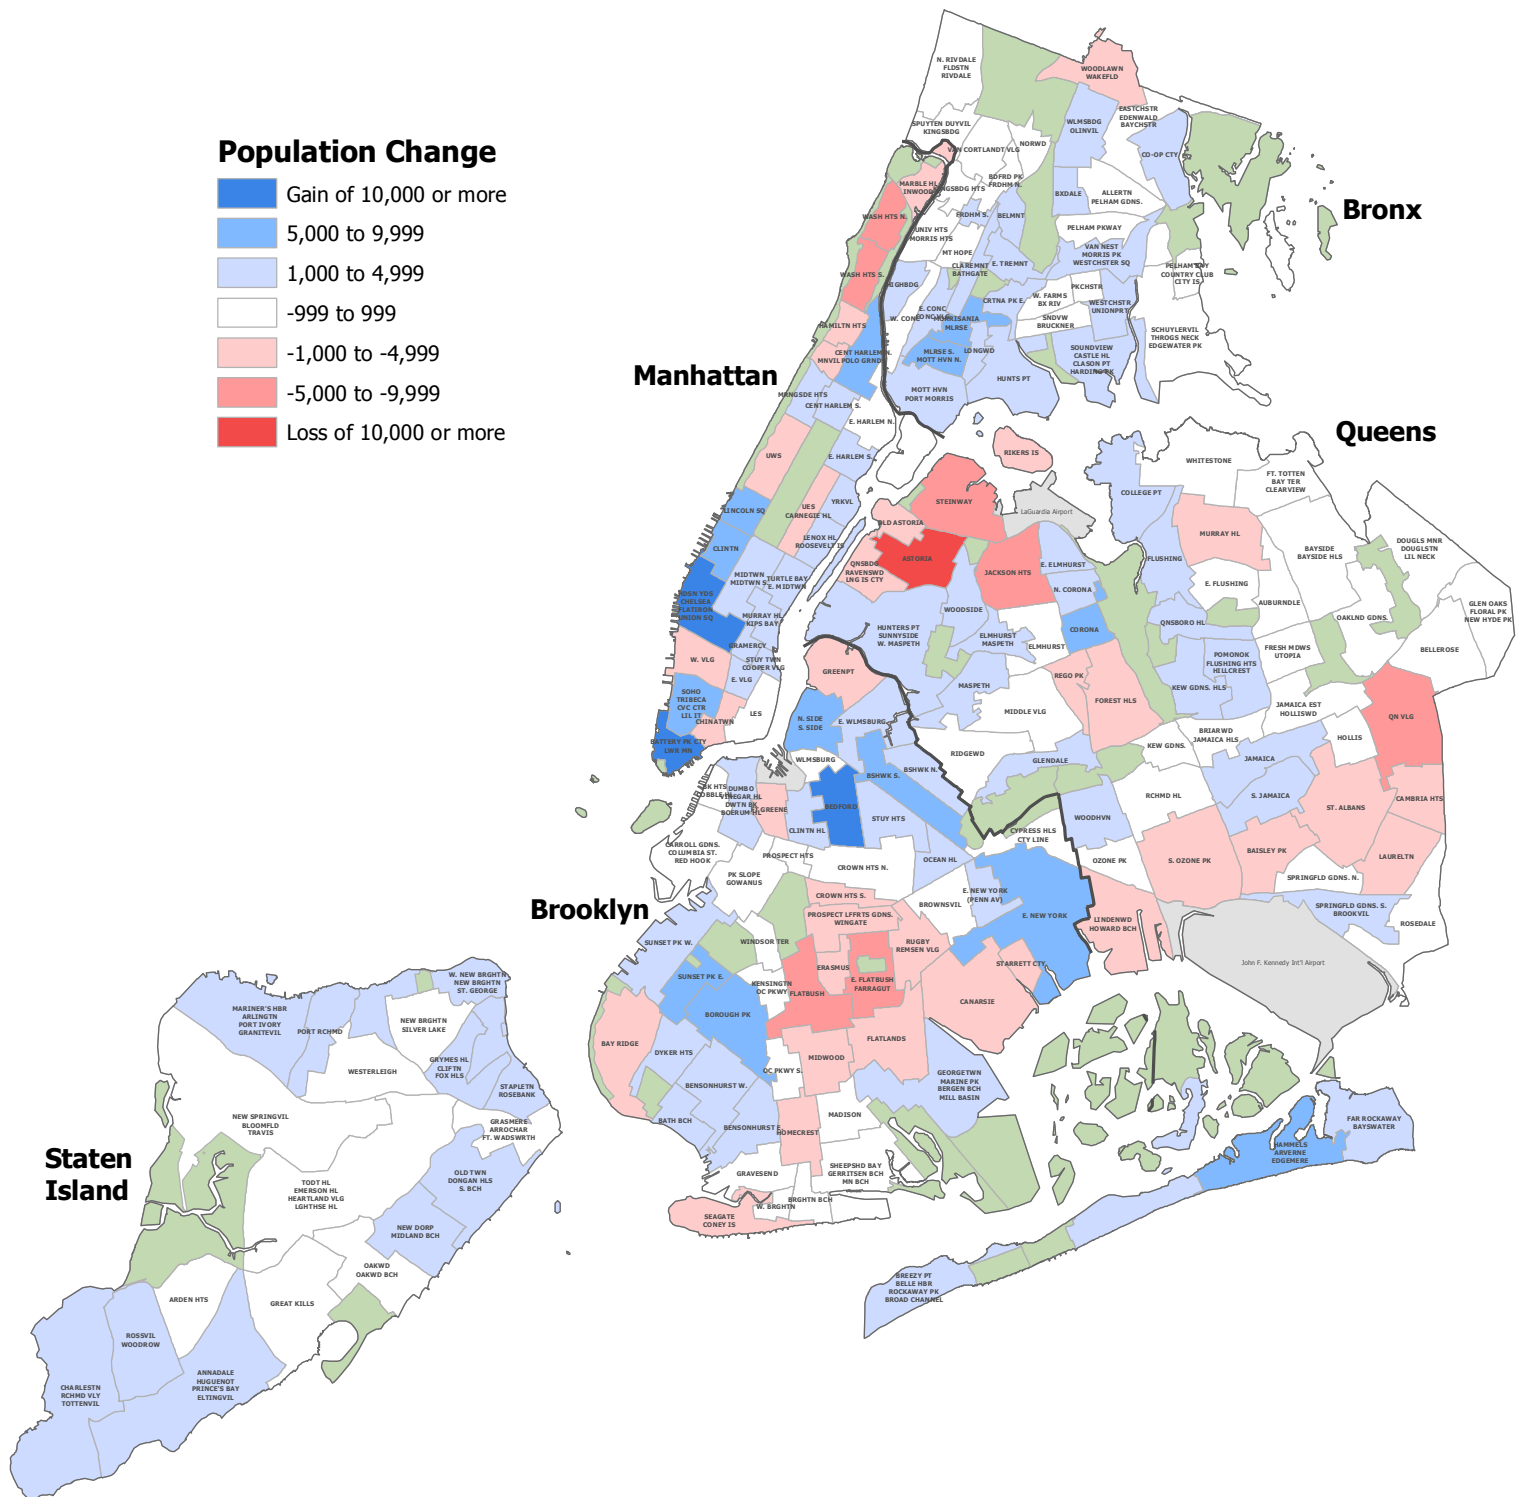

Source: US Census Bureau

Population Division
New York City Department of City Planning (March 2011)

Population by Borough, 1900-2010

-  In 2010, Queens and Staten Island reached their population peaks of 2,230,722 and 468,730, respectively.
-  Manhattan's population peaked in 1910, when it stood at 2,331,542, compared to 1,585,873 in 2010. At the start of the last century, Manhattan accounted for over one-in-two city residents, compared to under one-in-five in 2010.
-  With a population of 2,504,700 in 2010, Brooklyn had more people than any other borough. The borough's population reached its all-time high in 1950, when it stood at 2,738,175. Throughout the past century, Brooklyn accounted for over 30 percent of the city's population.
-  The Bronx, whose population peaked in 1970 at 1,471,701, experienced dramatic losses in the 1970s. Since then, the population of the borough has rebounded, reaching 1,385,108 in 2010. The Bronx has accounted for over one-in-six New Yorkers since 1930.

Population Change by Neighborhood Tabulation Area* New York City, 2000 to 2010

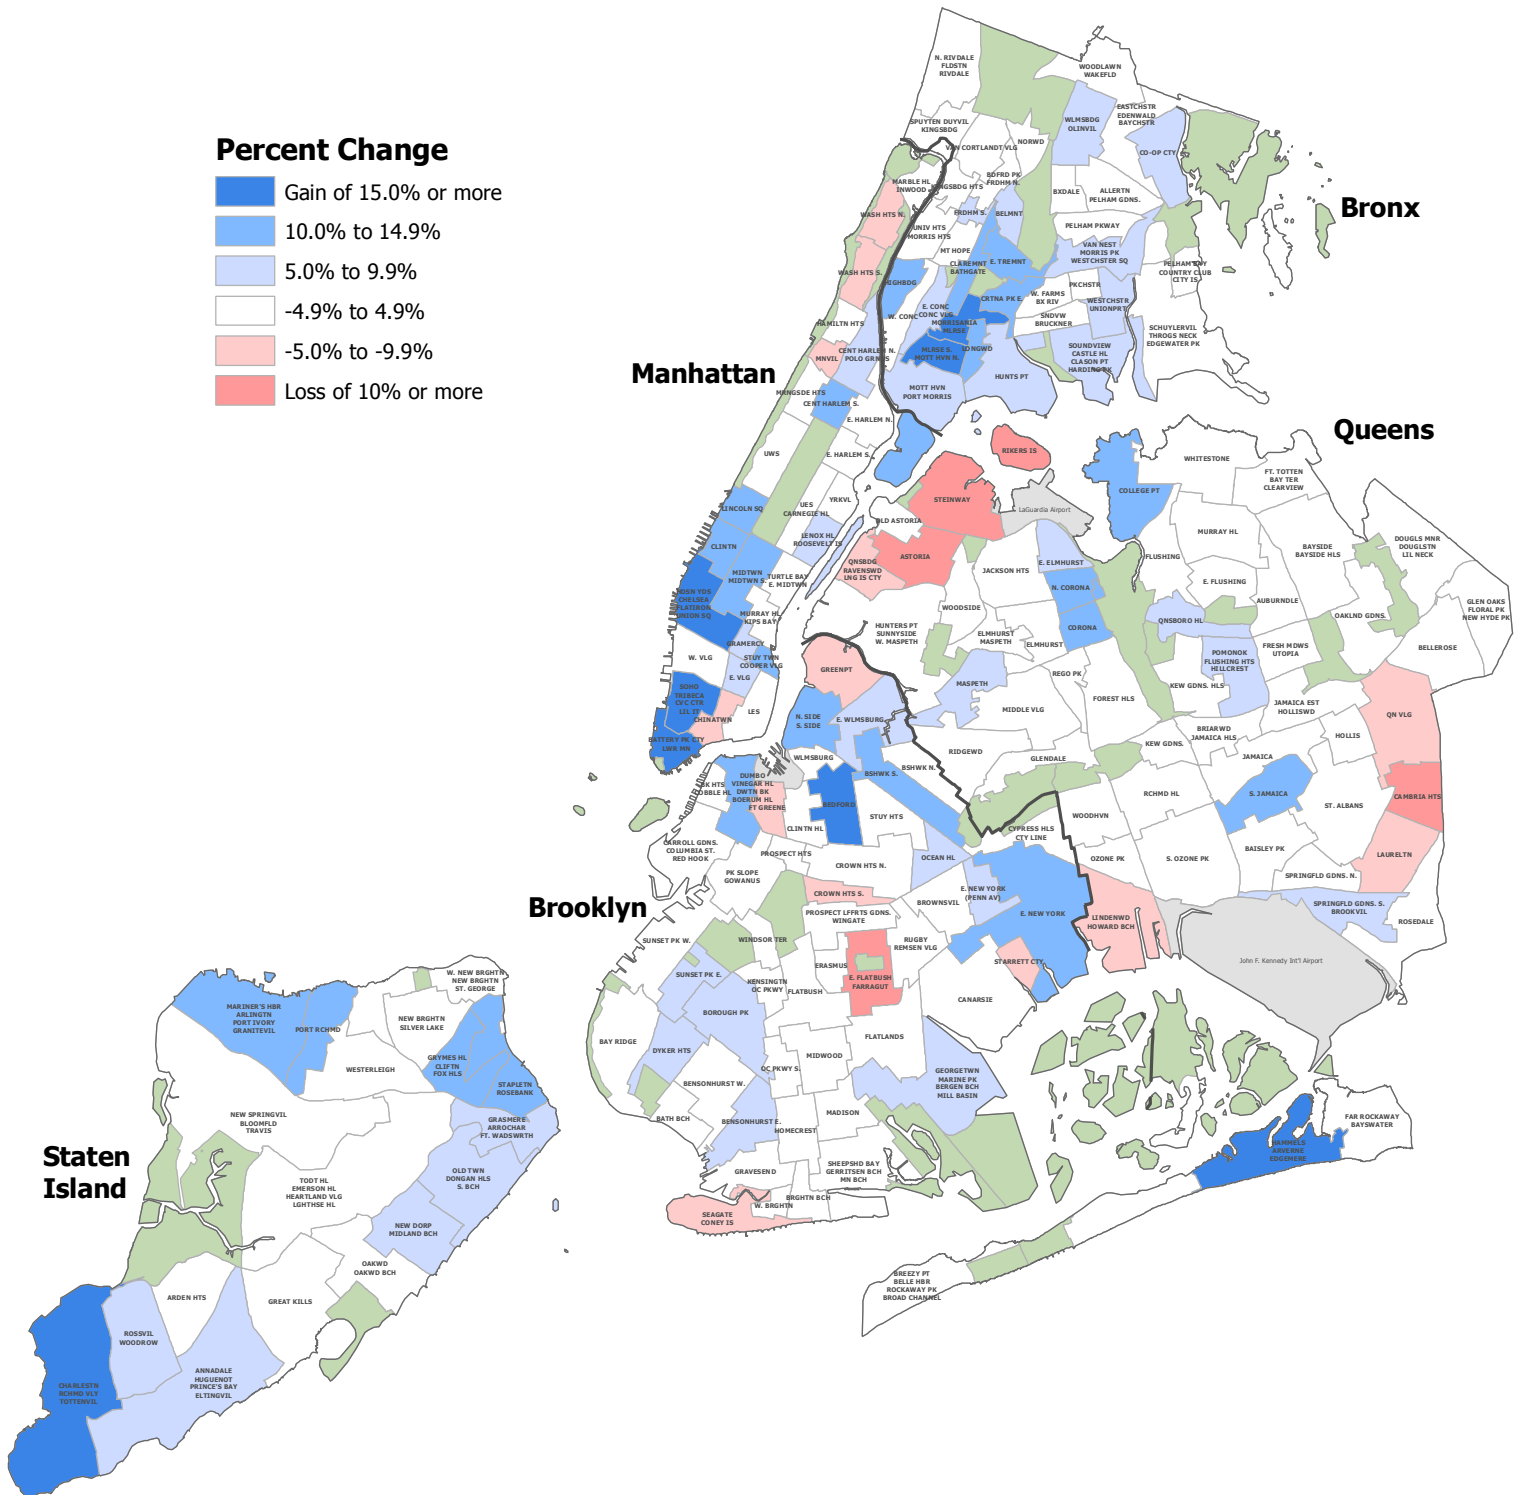

*Neighborhood Tabulation Areas or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods.

Population Change by Neighborhood Tabulation Area

-  Among the boroughs, the Bronx experienced the largest absolute gain in population (52,458) between 2000 and 2010. Morrisania-Melrose and Melrose South-Mott Haven North in South Central Bronx registered the greatest gain of residents (8,100 and 6,000 respectively), followed by East Tremont (4,100). These three neighborhoods accounted for 30 percent of the population growth in the Bronx. In contrast, Woodlawn-Wakefield experienced a decline of 1,100, residents.
-  Manhattan gained 48,678 between 2000 and 2010. Battery Park City-Lower Manhattan (19,600) and the adjoining neighborhood of SoHo-TriBeCa-Civic-Center-Little Italy (6,000) together accounted for over one-half of this increase. On the other hand, substantial losses were experienced by Washington Heights South (9,200), Washington Heights North (6,300), and Chinatown (4,500).
-  Staten Island's population grew by 25,000 between 2000 and 2010. Virtually every neighborhood on Staten Island increased with Charleston-Richmond Valley-Tottenville experiencing the largest gain in residents (4,980).
-  As noted earlier, minimal growth in Brooklyn and in Queens was likely a result of shortcomings of the census enumeration and is inconsistent with administrative data examined by the department. Brooklyn gained just 39,374 residents between 2000 and 2010. Bedford accounted for 11,500 of this increase, followed by East New York (8,700) and Sunset Park East (6,190). The greatest loss of enumerated residents in Brooklyn was concentrated in Central Brooklyn with East Flatbush-Farragut and Flatbush each losing over 5,000 residents.
-  Losses in Queens were particularly high in immigrant neighborhoods such as Astoria, which suffered the greatest population loss in the city – it lost over 10,000 residents. The adjacent neighborhoods of Steinway and Jackson Heights also lost significant numbers of persons (6,100 and 5,200 respectively). In contrast, the population of both Corona and Hammels-Arverne-Edgemere increased by over 5,000, followed closely by North Corona, which gained 4,900 persons.

Percent Change in Population by Neighborhood Tabulation Area*
New York City, 2000 to 2010

*Neighborhood Tabulation Areas or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods.

Percent Change in Population by Neighborhood Tabulation Area

-  The Bronx grew by 3.9 percent between 2000 and 2010, compared to 2.1 percent in the city overall. Population growth was concentrated in the southern sections of the borough. Morrisania-Melrose experienced the greatest increase (27 percent), followed by Melrose South-Mott Haven North (18 percent). The adjacent neighborhoods of Longwood, Crotona Park East, Highbridge, East Tremont, and Claremont-Bathgate also experienced growth of 10 percent or more. Eastchester-Edenwald-Baychester, Woodlawn-Wakefield, Kingsbridge Heights, and Pelham Bay-Country Club-City Island all experienced small declines in population (about two percent each).
-  Manhattan's overall growth was 3.2 percent, but many neighborhoods in the southern section of the borough showed substantially higher increases. Battery Park City-Lower Manhattan almost doubled its population over the decade. Hudson Yards-Chelsea-Flat Iron-Union Square also grew rapidly (26 percent), followed by SoHo-TriBeCa-Civic Center-Little Italy, Clinton, Lincoln Square, Central Harlem South, Midtown-Midtown South, and Stuyvesant Town-Cooper Village (each growing over 10 percent). On the other end of the spectrum, Washington Heights (north and south) and Chinatown each declined by eight percent or more.
-  Staten Island's growth of 5.6 percent was more than twice the city average, with nearly every neighborhood experiencing growth. Increases were largest in Charleston-Richmond Valley-Tottenville (27 percent), followed by Grymes Hill-Clifton-Fox Hills and Mariner's Harbor-Arlington-Port Ivory-Graniteville (each 13 percent).
-  There was minimal growth in Brooklyn and in Queens. As noted earlier the low growth was a result of shortcomings of the census enumeration and is inconsistent with administrative data examined by the department. Brooklyn's population increase was only 1.6 percent. Neighborhoods with higher growth were primarily around the perimeter. Bedford saw the largest increase (19 percent), followed by North Side-South-Side (14 percent). Other neighborhoods with a population increase of over 10 percent included DUMBO-Vinegar Hill-Downtown Brooklyn-Boerum Hill, Bushwick South, and East New York. East Flatbush-Farragut saw the largest decline (down 10 percent), while Starrett City, Greenpoint, and Fort Greene were each down about eight percent.
-  Population losses of 10 percent or higher in Queens occurred in immigrant neighborhoods of Astoria and Steinway, and in Cambria Heights. Growing neighborhoods included Hammels-Arverne-Edgemere (17 percent) and College Point (13 percent), Corona, South Jamaica, and North Corona (each up about 10 percent).

Race and Hispanic Origin for New York City

-  The race and ethnic categories used in the decennial census are established by the federal government to facilitate compliance with laws related to civil rights, equal employment opportunity, and other anti-discrimination mandates. The broad categories used in the Census include people of various backgrounds who may differ in important respects.
-  Asian nonhispanics saw the highest growth in the city (31.8 percent) between 2000 and 2010, with their population crossing the 1 million mark for the first time in 2010. Asians now account for 12.6 percent of the city's population.
-  The Hispanic population grew by 8.1 percent in the past decade, reaching 2,336,076 in 2010. Hispanics now account for 28.6 percent of the city's population.
-  While Asians and Hispanics saw a big increase in their numbers, the black nonhispanic population of the city declined by 5.1 percent, to 1,861,295 in 2010. Black nonhispanics now account for 22.8 percent of the city's population.
-  White nonhispanics remained the largest group, with a population of 2,722,904 in 2010, or one-third of the city's population. However, this represented a decline of 2.8 percent decline from 2000.
-  In 2000, the population of nonhispanics of two or more races was erroneously tabulated in New York. This population declined by 34 percent between 2000 and 2010, which was likely an artifact of the overstated multiracial population in 2000.

Race and Hispanic Origin for New York City Boroughs

-  Each of New York City's boroughs has a unique racial/Hispanic distribution. In the Bronx, Hispanics accounted for over one-half (53.5 percent) of the borough's population in 2010, followed by black nonhispanics (30.1 percent) and white nonhispanics (10.9 percent). White nonhispanics experienced their largest decline in the Bronx, falling 21.9 percent, compared to their overall decline in the city of under three percent.
-  White nonhispanics (35.7 percent) and black nonhispanics (31.9 percent) together comprised over two-thirds of Brooklyn's population, while Hispanics accounted for 19.8 percent. However, Asian nonhispanics were the fastest growing group in the borough increasing by 41.2 percent during the decade, while white nonhispanics increased in Brooklyn even as their numbers declined citywide.
-  Queens continues to be the most diverse borough in the city, with a substantial representation of every group. White nonhispanics and Hispanics each accounted for 28 percent of that borough's population in 2010, followed by Asian nonhispanics (22.8 percent) and black nonhispanics (17.7 percent). Although the population in Queens was essentially unchanged during the decade, there were significant changes for race and Hispanic groups: The number of white nonhispanics declined by 15.9 percent, while Asians increased 30.6 percent.
-  Staten Island continues to be the only borough with a clear white majority, but the share of white nonhispanics dropped from 71 percent in 2000 to just 64.0 percent in 2010. Staten Island was the only borough that showed a substantial increase in the number of black nonhispanics (11.6 percent) and an above-average increase in Hispanics (51.4 percent).
-  White nonhispanics also had a substantial representation in Manhattan where they comprised 48.0 percent of the population in 2010, up from 45.8 percent in 2000. Manhattan had the greatest increase in number of white nonhispanics (8.2 percent, compared to an overall 2.8 percent decline in the city) and the largest decrease in black nonhispanics (down 12.5 percent, compared to 5.1 percent overall). And while the city overall experienced an increase in the number of Hispanics (8.1 percent), the number of Hispanics in Manhattan declined by 3.4 percent.
-  Brooklyn and Manhattan were the only two boroughs that saw an increase in the number of white nonhispanics, while Staten Island was the only borough with a meaningful increase in black nonhispanics. Hispanics grew in each borough, with the exception of Manhattan, while each borough in the city saw an increase in Asians.

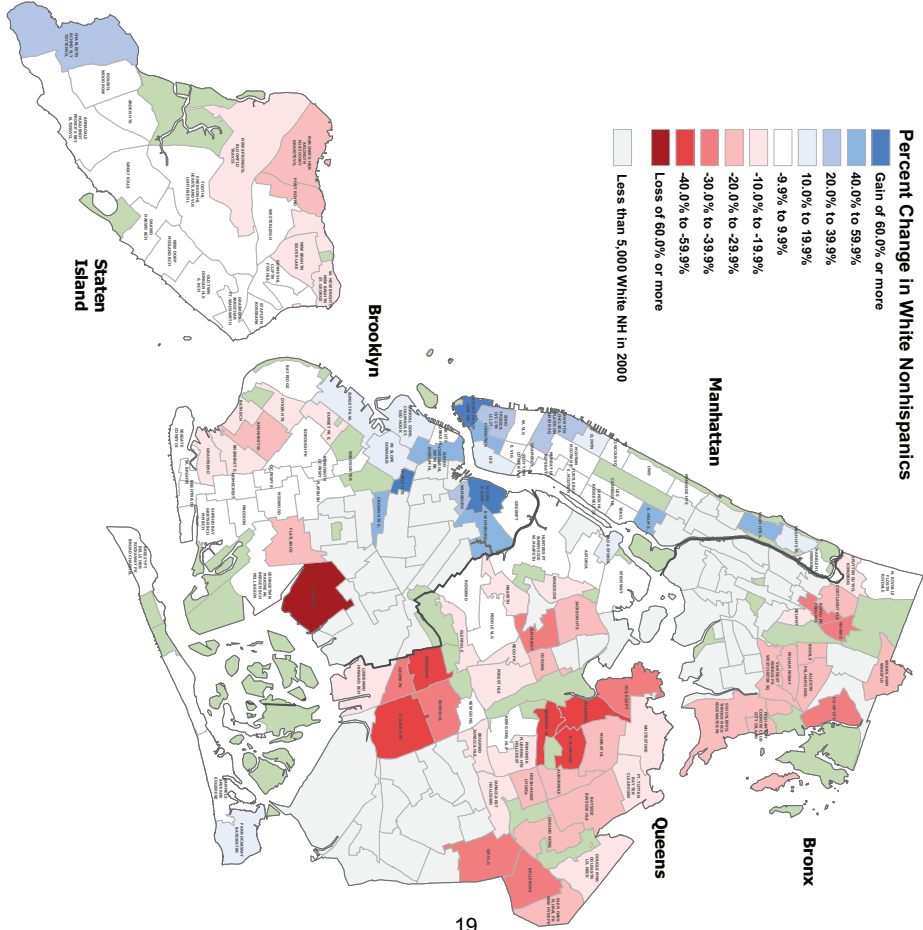

White Nonhispanic Population by Neighborhood Tabulation Area

-  The white nonhispanic (hereafter referred to as white) population of New York City has been declining since the 1950s, though the rate of decline slowed considerably between 2000 and 2010 to under three percent. The Bronx experienced the greatest decline (22 percent), followed by Queens (16 percent), and Staten Island (5 percent). Brooklyn and Manhattan actually posted gains in whites during this period.
-  Brooklyn is home to more whites than any other borough. White gains in Brooklyn were fueled by increases in the northwest section of the borough: North Side-South Side saw a 75 percent increase in whites, while there was a 55 percent increase in DUMBO-Vinegar Hill-Downtown Brooklyn-Boerum Hill, and a 43 percent rise in East Williamsburg. By 2010, whites also had a strong presence in Bedford. In contrast, Canarsie lost 63 percent of its white population, while Flatlands and Bensonhurst West saw declines of 30 percent and 21 percent, respectively.
-  Neighborhoods that experienced the greatest growth in Manhattan were in Lower Manhattan and in Harlem. The number of whites in Battery Park City-Lower Manhattan almost doubled from 13,800 in 2000 to 26,000 in 2010, while there were significant increases in Chinatown (42 percent) and in East Harlem South (55 percent). In 2010, there was a small presence of whites in Central Harlem South and North-Polo Grounds, which was particularly notable given their negligible presence in these neighborhoods a decade earlier. In addition, there were notable increases in the northern Manhattan neighborhoods of Washington Heights South and Hamilton Heights.
-  Whites declined across Queens, particularly in the eastern section of the borough. Flushing and East Flushing each lost over 40 percent of their white populations, while the neighboring areas of Corona, Jackson Heights and Elmhurst each lost between 21 and 31 percent. There were also decreases in the southeast neighborhoods of Ozone Park, Woodhaven, and Richmond Hill – though they did not have large white populations in 2000.
-  In Staten Island, whites increased by 25 percent in Charleston-Richmond Valley-Tottenville in the south, but decreased along the north shore.
-  The Bronx was home to just 151,000 whites in 2010, primarily in the northern sections of the borough, areas that saw some of the sharpest declines. Co-op City experienced the greatest decline (39 percent), followed by Norwood (37 percent), and Bedford Park-Fordham North (35 percent).

Hispanic Population by Neighborhood Tabulation Area

-  The growth of Hispanics continued in the first decade of the 21st century, up eight percent since 2000. With the exception of Manhattan, all boroughs experienced increases. Brooklyn had the smallest increase (under two percent) resulting in the Hispanic population becoming increasingly concentrated in the Bronx and Queens.
-  Over one-half of Hispanics in the city live in the Bronx and nearly every neighborhood in the borough posted gains. While Hispanics are concentrated in the southern and western portions of the borough, the greatest gains were in neighborhoods outside these areas, including Schuylerville-Throgs Neck-Edgewater Park (up 50 percent) and Williamsbridge-Olinville (41 percent).
-  The largest Hispanic concentrations in Queens were in the northcentral sections of the borough, which also saw among the highest increases. Corona saw its Hispanic population increase by over one-third, while Hispanics in North Corona grew by one-fifth. Other neighborhoods with notable gains include Woodhaven in southeastern Queens (28 percent), the Rockaway neighborhoods of Far Rockaway-Bayswater (10 percent) and Hammels-Arverne-Edgemere (54 percent). There were a handful of neighborhoods where the number of Hispanics decreased; Flushing, in particular, had a substantial decline, losing one-quarter of its Hispanic population.
-  The overall Hispanic population in Brooklyn showed very little change; however, this masked some rather significant shifts within the borough. The greatest areas of growth occurred in the southern neighborhoods of Bensonhurst West (61 percent) and Bensonhurst East (56 percent), areas with relatively small Hispanic populations in 2000. In addition, the Hispanic population increased considerably in Stuyvesant Heights (35 percent) and neighboring Crown Heights North (28 percent). Conversely, the northern sections of the borough saw large declines, with Hispanics declining by one-quarter in North Side-South Side and by one-fifth in East Williamsburg.
-  While the growth of Hispanics in Staten Island took place across all neighborhoods, the majority of the increase was concentrated along the north shore: Mariners Harbor-Arlington-Pt Ivory-Granitville (up 52 percent), Stapleton-Rosebank (45 percent) and West New Brighton-New Brighton-St. George (44 percent).
-  The loss of Hispanics in Manhattan was notable in neighborhoods where they had the strongest borough concentration – Washington Heights North and South – where Hispanics declined 15 and 12 percent, respectively. In addition, there was a decline of 12 percent in the number of Hispanics on the Upper West Side and a drop of 10 percent on the Lower East Side. Hispanics grew fastest in Central Harlem North-Polo Grounds (59 percent), followed by Central Harlem South (22 percent).

Black Nonhispanic Population by Neighborhood Tabulation Area

-  After decades of strong growth, the number of black nonhispanics (hereafter referred to as blacks) in New York City declined by 100,100, or five percent, in the first decade of the 21st century.
-  Staten Island was the only borough that experienced an increase in their black population (12 percent). The black population resides primarily along the north shore of the borough and these were the same areas that saw growth, with Mariner's Harbor-Arlington-Port Ivory-Graniteville experiencing the most significant increase (23 percent).
-  Manhattan's black population is heavily concentrated in the northern sections of the borough. Black losses in this section were responsible for most of the nearly 30,000 (13 percent) decline in the blacks, more than any other borough. The loss was particularly significant for the historically black neighborhoods of Central Harlem South (14 percent) and North-Polo Grounds (10 percent). Hamilton Heights to the north, while home to fewer blacks, lost over one-quarter of its black population.
-  Brooklyn was home to 799,100 blacks, more than in any other borough. While the overall black population in Brooklyn declined by nearly 6 percent, there were notable increases in Canarsie (18 percent) and East New York (13 percent). The long-established West Indian neighborhoods of Crown Heights, Flatbush, and Prospect Lefferts Gardens each lost between 10 and 14 percent of their black populations. Blacks in northern Brooklyn, while less numerous, experienced the sharpest declines: Fort Greene declined by 32 percent, and there were substantial losses in Clinton (29 percent) and Bedford (15 percent).
-  The overall number of blacks in the Bronx remained essentially unchanged between 2000 and 2010. In the north, home to the largest concentration of blacks, Co-op City experienced the greatest growth (11 percent). However, in the western portion of the borough, there was an overall decline in the number of blacks, with University Heights–Morris Heights falling by 18 percent. But gains were made across the south Bronx, with the largest increase in Melrose South-Mott Haven North (22 percent).
-  Overall, the number of blacks in Queens declined by six percent, with losses primarily in southeast Queens, home to the largest concentration of blacks in the borough. Baisley Park and Jamaica experienced the most significant decreases (about 15 percent each). However, there was strong growth in neighboring Richmond Hill (22 percent) and Rosedale (11 percent). Other parts of the borough had pockets of losses, the most notable being in East Elmhurst, which lost almost half of its black population.

Asian Nonhispanic Population by Neighborhood Tabulation Area

-  Asian nonhispanics (hereafter referred to as Asians) continue to be the fastest growing group in the city, up 32 percent between 2000 and 2010. Asian growth in Brooklyn (40 percent) was higher than any other borough. The Asian population in Brooklyn was concentrated in the southwestern section of this borough, also home to the fastest growing Asian populations in the city. Asians increased by 62 percent in Sunset Park East, almost doubled in neighboring Dyker Heights, and grew 68 percent in Bath Beach. The number of Asians in Bensonhurst East and West also increased significantly (58 percent and 57 percent, respectively).
-  While Queens is home to the largest number of Asians, the increase in this borough (31 percent) was at the city average. Flushing, home to the highest concentration of Asians in the city, saw its Asian population increase by 37 percent. There was also strong growth in the adjacent neighborhoods of Queensboro Hill (45 percent), East Flushing (45 percent) and Murray Hill (32 percent), as well as in Bayside-Bayside Hills (49 percent) and Douglas Manor-Douglaston-Little Neck (57 percent). Asians increased their presence in southeastern Queens, with Jamaica growing the fastest (75 percent), followed by Richmond Hill (38 percent). Elmhurst, with the second largest concentration of Asians in Queens, posted gains (18 percent) well below the boroughs average.
-  Chinatown in Manhattan, the well-established and historic Chinese enclave, lost 15 percent of its Asian population. The adjacent neighborhood of SoHo-TriBeCa-Civic Center-Little Italy also saw its Asian population decline (7 percent). However, the Asian presence on the Lower East Side continued to grow, increasing by 10 percent; in 2010, it ranked as the second largest Asian neighborhood in Manhattan. And even though their base populations are small, some of the fastest growing Asian populations were along the East River: Murray Hill-Kips Bay (up 50 percent), Yorkville (41 percent) and Lenox Hill-Roosevelt Island (38 percent).
-  The Bronx is home to just 47,300 Asians and their growth (22 percent) was below the city average. No Bronx neighborhood has a large Asian concentration; Norwood had the largest number Asian residents, but they numbered only 4,500. Neighborhoods with an increasing Asian presence include Parkchester, Van Nest-Morris Park-Westchester Square, and Westchester-Union Port.
-  The number of Asians on Staten Island grew by 40 percent between 2000 and 2010. The neighborhood with the largest concentration of Asians, New Springville-Bloomfield-Travis, saw an increase of 31 percent. Another neighborhood with an increasing presence was Grymes Hill-Clifton-Fox Hills (up 90 percent).

Total Housing Units

The 2010 Census enumerated 3,371,062 housing units in New York City, an increase of 170,150 units, or 5.3 percent since 2000. The largest increase was in Staten Island (7.7 percent), followed by Brooklyn (7.5 percent), and in Manhattan (6.1 percent). The increase in housing units was below average in the Bronx (4.3 percent) and in Queens (2.2 percent).

The highest absolute increases were in Brooklyn (69,427 units) and in Manhattan (48,946 units).

While we cannot separately quantify exactly how much of the increase in housing units in the city occurred as a result of newly constructed buildings versus the subdivision of existing housing units, we know through our administrative data on housing units (i. e., permits and certificates of occupancy) that new construction played a major role in what is a substantial increase in the city's housing stock.

Total Housing Units and Vacancy Status

Population Division
New York City Department of City Planning (March 2011)

Vacant Housing Units

-  The city had 261,278 housing units that were vacant as of April 1, 2010, compared to 179,324 in 2000, an increase of 45.7 percent. The percentage of all housing units determined to be vacant increased from 5.6 percent in 2000 to 7.8 percent in 2010.
-  While the overall number of vacant housing units grew by 81,954 or 45.7 percent between 2000 and 2010, there were big differences by borough. Vacant units increased by 66.4 percent (33,298 units) in Brooklyn and by 59.1 percent (20,424) in Queens, and by 45.6 percent (3,488 units) in Staten Island. In contrast, the number of vacant units increased by 3.6 percent (1,000 units) in the Bronx.
-  Housing units can be vacant for several reasons, including those that are available for rent or sale but not yet occupied and units that are occupied only seasonally or are for occasional use (where according to Census Bureau residency rules people live “most of the time in another place”). It is important to keep in mind that places with large numbers of newly constructed units, built later in the decade, are more likely to experience jumps in the level of vacancies.
